# Buffers

---

# Why do we use buffers in programming?

We use buffers because often writing data to the buffer is faster than immediately operating on it.

# How Do We Use Buffers?

We might originally have something like this:

```
1  #include <unistd.h>
2  const int BUFSZ = 10000; // the amount of 'a's to process
3
4  void process_data(const void * data, int data_length) {
5      usleep(10); // function startup cost
6      usleep(data_length);
7      usleep(10); // function shutdown cost
8  }
9
10 int main() {
11     char buf = 'a'; // declare a 'buffer' of size 1 holding an 'a'
12     for (int i = 0; i < BUFSZ; i++) {
13         // process the 'a' BUFSZ times
14         process_data(&buf, 1);
15     }
16 }
```

## Performance of `processNoBuffer.cpp`

```
real    0m2.267s
user    0m0.045s
sys     0m0.131s
```

# An Improvement Using A Buffer

We can improve our performance

```
1  #include <unistd.h>
2  const int BUFSZ = 10000; // the amount of 'a's to process
3
4  void process_data(const void * data, int data_length) {
5      usleep(10); // function startup cost
6      usleep(data_length);
7      usleep(10); // function shutdown cost
8  }
9
10 int main() {
11     char buf[BUFSZ]; // declare a buffer of size BUFSZ
12     for (int i = 0; i < BUFSZ; i++) {
13         buf[i] = 'a'; // fill the buffer with 'a's
14     }
15     // process all the data at once
16     process_data(&buf, BUFSZ);
17 }
```

## Performance of processWithBuffer.cpp

```
real    0m0.014s
user    0m0.001s
sys     0m0.001s
```

## Assignment Info

---

## Email Availability

- I will be answering questions that get into my inbox by 11:59pm Thursday. If you email me Friday with questions about Assignment 1, you will not get a reply.

# General Reminders

- The assignment is due this Friday.
- Don't plagiarize. If you can find a solution online, I can too.
  - The Midterm and Final

## Question 5

- Q5 of the assignment must run on the Linux computers and produce the same output as the given `countLines.cpp`.
  - I will be testing your program with a file of unknown (to you) size. So don't hard-code the number of lines or make assumptions about the size of the file.
  - The number of newlines in the file will still fit within an `int`.
- You will get 0 marks for using `fstreams` or C++ streams instead of `read()` to read the file.
  - Using C++ streams (`std::cout`) for output to `stdout` is allowed and recommended.
- If you want to know more about the `read` command, use:  
`man read.3`
- Please don't make your code unreadable. If your code is not well styled or completely lacks comments, you will lose 1 mark.

# Exercises

---

1. Try running the buffer examples on your own.
2. Work on your assignment.
